

Evidence envelope and payload minimisation

TrustEvidenceEnvelope

evidence_core (signed)

Identity and event type Biomedical accountability

evidence_id; event_id;
event_type

pseudonymous subject; object
bindings; event_facts

Time and origin

occurred_at; emitted_at;
time_source

Governance bindings

policy and consent when
required

Operational context

actor (conditional); emitter;
purpose; outcome

Minimisation and binding

privacy profile; optional
payload commitment; emitter
signature

backend_receipt (signed)

Log identity Inclusion binding Receipt authenticity

backend_id; log_id;
receipt/hash/tree
profiles

core/leaf digest;
index; size; root;
inline proof

proof digest;
issued_at; signer key;
receipt signature

Retained accountability content

- event/accountability metadata and
cryptographic bindings

Excluded from public envelope

- raw samples; physiological values;
unrestricted payloads

- direct identifiers; email addresses; local
infrastructure paths

Commitment check uses withheld payload + nonce.

Withheld authorised side

- payload bytes and random nonce for later
commitment checking

Binding is not encryption or anonymisation; source truth and clinical validity are outside this envelope.
